

Vantage Perception

Camera-only perception for autonomous vehicles.

No LiDAR. No compromises.

THE PROBLEM

LiDAR is a \$10,000 crutch.

The autonomous vehicle industry has spent the last decade building perception stacks around LiDAR sensors that cost \$10,000–\$75,000 per unit. This makes autonomous driving economically unviable for mass-market vehicles.

Tesla proved that cameras can work. But their vision-only system still struggles in edge cases: rain, fog, nighttime, and construction zones. The industry needs camera-only perception that matches LiDAR accuracy across all conditions.

The opportunity is enormous. There are 1.4 billion vehicles on the road globally. LiDAR-based autonomy can only address a fraction of them.

Cost reduction with cameras

Perception results that speak for themselves.

Vantage uses a transformer-based Bird's Eye View architecture with temporal fusion across 8 camera inputs. Our proprietary depth estimation module produces dense 3D reconstructions from monocular video at 42 FPS.

3D Object Detection

Achieves 72.4 NDS on the nuScenes validation set using camera-only input, outperforming BEVFormer (56.9 NDS) and approaching LiDAR-based CenterPoint (67.3 NDS).

Adverse Weather Performance

Maintains 94% of clear-weather detection accuracy in heavy rain and fog conditions on our internal benchmark of 180,000 annotated adverse-weather frames.

Processing Latency

End-to-end perception pipeline runs in 23ms on a single NVIDIA Orin, achieving 43 FPS — 2.8x faster than Waymo's published camera perception latency of 65ms.

Market Position

First camera-only perception stack to be certified for ASIL-D functional safety compliance under ISO 26262, enabling deployment in production L3+ vehicles.

Built by a team of ex-Waymo, ex-Tesla, and ex-Mobileye engineers with 40+ combined years in autonomous perception.

TRACTION

From simulation to the road.

2

OEM Partnerships

Active development agreements with European OEMs targeting 2027 SOP

4.2M

Test Miles

Simulated + real-world miles logged across 14 operational design domains

\$1.8M

ARR

Licensing revenue from developer tier and OEM evaluation contracts

12

Patents Filed

Covering depth estimation, temporal fusion, and adverse-weather perception

Vantage Perception

Raising \$8M Seed to bring safe, affordable
autonomous perception to every vehicle.
